

**Stand 21** has innovated again! For several years, the R&D department has developed a research program preventing from **Heat Stress** (see the sketch) with a major step: the **1st FIA standard homologated "AIR FORCE" racing suit!** Its ingenious concept relies on its simplicity: it does not need any air injection by compressor or any other device. **The Venturi effect spreads the air to the key parts of the body!**

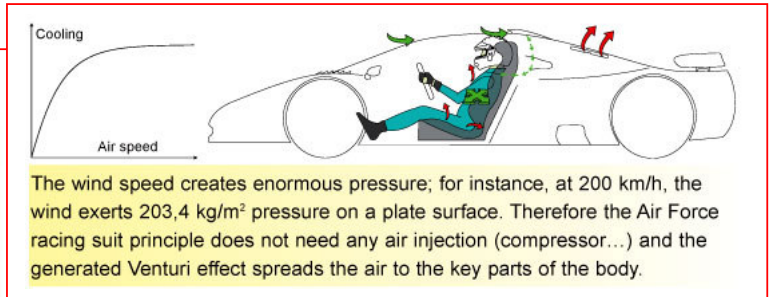

Aware of the **Heat Stress** phenomenon and its dramatic consequences on both health and performance, **Stand 21 R&D** is proud to contribute to the racing driver's comfort and results by bringing him **the Air Force racing suit.** "We have adapted our **Air Force** ventilation concept, previously used on our helmets, to our new racing suit. It is another huge step for the driver' safety."

**What you must know**

Wind contributes to the driver's comfort in two ways:

- By convection: the air flows inside the body and cools it with the same principle as in car radiator
- By evaporation: the forced air on the skin surface pushes out the sweat (this is the most efficient method)

More than just a racing suit, **the Air Force** will not only help you stay cool inside your body but also win in competitiveness!

"**Stand 21** is not a mere manufacturer; it is **the racing driver's engineer** which helps you achieve optimum performance by bringing you adapted solutions to your own driving conditions. "

***This concept uses a highly breathable fabric which pushes both the sweat and the air out of the racing suit!***

**Patent pending...**
