

A basic move for the racing driver, a land mark for his safety

Developped in the USA, nowadays the H.AN.S® device (Head and Neck Support) is becoming more and more significant in the racing driver equipment (Compulsory in Nascar, Cart, IRL, F1...).

The H.AN.S® device aims to restrain the head in case of frontal impact and thus avoids shocks to head (forward movement of the head) and injuries including the rupturing of the neck vertebra.

Stand 21 helmets can, at your request, be H.AN.S® device pre-equipped (loops are fitted during manufacture) under the SNELL SA 2000 homologation.

"The primary cause of mortality for racing drivers (according to American medical records) is a fracture at the base of the skull (junction between the spine and the skull)"

For more information feel free to contact your local Stand 21 agent (www.stand21.fr) or (33) (0)3 80 53 92 21.
